CLASS 3 - IRISH POTATO PRODUCTION EXHIBIT SCORING

Entries in this class will be judged on yield per acre and on an exhibit consisting of sixteen (16) selected potatoes.

YIELD VERIFICATION

Yields to be verified before or after harvest by authorized agent of the Fair Association, designated in cooperation with the UT Extension and Department of Vocational Agricultural. Yield scores will be provided to Department Superintendent at time of entry.

POTATO YIELD DETERMINATION BEFORE HARVEST

All row-crop yields can be directly determined without computation by weighing the yield from a specified row length and moving decimal point left or right. In the case of potatoes in 3ft rows, the pounds produced on 24 ft. of row give acre yield in 60 pound bushels by moving the decimal point one space to the right.

Example: 26.5 pounds equals 265 bushels per acre.

Yield checking should be done after vines have died and before crabgrass takes over. Three to five samplings should be taken per acre, averaged together. Samplings should properly represent field variability. The less variable the vine growth, the fewer the yield samplings needed. Indicate weight of each sample.

Row length harvested is related to row spacing as follows: 32"=27'6", 36"=24'0", 38"=22'8", 42"=20'7"

Most useful equipment for field checking is a long-handled, six-tine fork, a basket, and a spring scale.
